

ELECTRONIC CLUTCH

The Electronic Clutch serves an innovative and practical solution for actuating the clutch from the gear knob. The lever on the gear knob controls the clutch action and makes the clutch pedal obsolete.

The electronic interface can be programmed to manual or automatic. In manual, the clutch movement is proportional to the lever on the gear knob. In automatic, the clutch movement is proportional to the engine rpm and vehicle speed. The automatic system intuitively knows at what rate to release the clutch, ensuring smooth and trouble free driving.

Compatible with the vehicle's original electronics and turned off by the flick of a switch, enabling normal clutch operation to resume. Suitable for installation in most clutch operated vehicles.

FEATURES

- Manual or automatic clutch suppression
- No additional clutch wear
- Compatible with most vehicle types
- Designed and manufactured in Italy
- Easy hand operation of the gear knob
- Programmed specifically to the vehicle
- Reliable and proven equipment
